Specifications

UP-90

Compressor Model	UP-90
Number of cylinders	10
Displacement	92 cc/rev
Refrigerant	HFC-134a
Initial oil charge	140 cc
Oil type	Unidap 7 (PAG oil)
Weight without clutch	3.7 kg

UP-120

Compressor Model	UP-120
Number of cylinders	10
Displacement	119 cc/rev
Refrigerant	HFC-134a
Initial oil charge	140 cc
Oil type	Unidap 7 (PAG oil)
Weight without clutch	4.3 kg

UP-150

Compressor Model	UP-150
Number of cylinders	10
Displacement	145 cc/rev
Refrigerant	HFC-134a
Initial oil charge	160 cc
Oil type	Unidap 7 (PAG oil)
Weight without clutch	4.8 kg

UP-170

Compressor Model	UP-170
Number of cylinders	10
Displacement	172 cc/rev
Refrigerant	HFC-134a
Initial oil charge	160 cc
Oil type	Unidap 7 (PAG oil)
Weight without clutch	4.9 kg

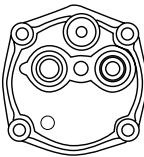

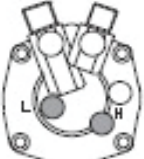

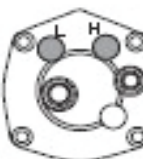

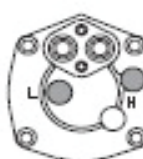

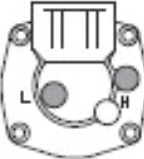

Magnetic clutch

A SERIES COMPRESSOR SERVICE MANUAL

Removal of clutch assembly

I. Removal of fixing screw on armature

Tools required: • Stand • Clutch wrench
• Wrench • 10mm Socket

Procedure: Place the compressor on the stand. Hold clutch by inserting the claws of the clutch wrench into the holes on the armature. Remove the centre bolt by using the wrench.

II. Removal of armature

Tools required: • Hub remover • Wrench

Procedure: Pull the armature upwards.

III. Removal of snap ring

Tools required: • Snap ring pliers (shaft)

Procedure: Remove the snap ring with the snap ring pliers.

IV. Removal of pulley assembly

Tools required: • Remover, pulley • Wrench • Pulley pad

Procedure: Remove the pulley assembly with the remover.

V. Removal of coil (3 bolt type)

Tools required: • Standard screwdriver

Procedure: Remove 3 M5 bolts with screwdriver.

Removal of coil (snap ring type)

Tools required: • Snap ring pliers (shaft)

Procedure: Remove the snap ring with pliers as shown.

VI. Inspection of clutch components

1. Armature - Contact surface must be clean, smooth and unmarked, with no abnormal scoring.

2. Pulley - Contact surface must be clean, smooth and unmarked, with no abnormal scoring.

3. Coil - Wiring harness must be in good condition.

Armature

Pulley

Coil

Magnetic clutch installation

I. Installation of coil (3 bolt type)

Tools required: • Stand • Standard screwdriver

Procedure: Tighten 3 M5 bolts (*wire must be visible at 3 o'clock position, when viewed from the front*).

Tightening torque: $4.9 \pm 1 \text{ N}\cdot\text{m}$

Installation of coil (snap ring type)

Tools required: • Stand • Snap ring pliers (*shaft*)

Procedure: Install the snap ring into the groove.

II. Installation of pulley

Tools required: • Pulley installer • Plastic hammer

Procedure: Place the pulley on the nose top and install it by tapping on the installer until it stops. Do not tap if the pulley is not located correctly.

III. Installation of clutch snap ring

Tools required: • Snap ring pliers (*shaft*)

Procedure: Install the snap ring into groove (*tapered side up*).

IV. Installation of shims and armature

Tools required: • Guide pin

Procedure: Install the guide pin into the centre threaded hole of the shaft and select shims ($T=0.1, 0.3$ and 0.5mm) to ensure the clutch clearance as in figure.

V. Installation of armature

Tools required: • Clutch wrench • Torque wrench

• 10mm Socket

Procedure: Install the M6 bolt by holding the clutch wrench on the holes (*3 positions*) on the armature.

Tightening torque: $13.7 \pm 1 \text{ N}\cdot\text{m}$

VI. Air gap

Tools required: • Thickness gauge

Procedure: Ensure clutch clearance is correct all around.
($0.3\text{mm} \leq \text{Gap} \leq 0.6\text{mm}$)

Removal of lip seal

I. Removal of the felt ring

Tools required: • Lipseal remover

Procedure: Insert the remover into the recess of the felt seal and turn around lightly and pull. Remove the felt on the shaft by hooking with the needle tool.

II. Removal of snap ring

Tools required: • Snap ring pliers (hole)

Procedure: Remove the snap ring slowly with pliers as shown in the figure.

III. Removal of lip seal

Tools required: • Lipseal remover

Procedure: Insert the remover into the recess of the seal and turn around lightly and pull.

IV. Inspection of lip seal

1. **Felt seal** - should be dry.
2. **Snap ring** - must be in one piece and not deformed.
3. **Lip seal** - contact surface must be clean, smooth and unmarked with no abnormal scoring.

Installation of lip seal

I. Setting the guide sleeve

Tools required: • Stand • Guide sleeve • Seal installer

Procedure: Place compressor on the stand. Lubricate outside of the guide sleeve and insert into the shaft of the compressor.

Caution - the sleeve must be clean and unmarked.

II. Installation of lip seal

Tools required: • Guide sleeve • Seal installer

Procedure: Slide the lipseal over the guide sleeve. Place the installer on the lip seal correctly and press the lipseal with the installer until it stops. Then remove the guide sleeve.

Installation of lip seal - *continued*

III. Assembly of the snap ring

Tools required: • Snap ring pliers (*hole*) • Seal installer

Procedure: Insert the snap ring into nose section (*tapered part of the snap ring must be facing downwards*). Push the snap ring downward with the installer, and fit into the groove.

IV. Assembly of the felt seal

Tools required: • Installer seal

Procedure: Install the felt seal into the nose section. Push the felt seal until it touches the snap ring.

Disassembly of the body

Caution - O-ring should not be reused.

I. Removal of oil

Procedure: Remove the drain plug and drain the oil.

II. Removal of lipseal (Refer to page 9 for instructions)

III. Removal of the bolts on rear cap

Tools required: • Socket wrench • Socket 6mm hex • Stand

Procedure: Remove the M8 securing bolts (4pcs) from the rear cap.

IV. Removal of the rear cap

Procedure: Remove the rear cap by gently inserting a screw driver or lever into the recess. Lever all around, not just at one position.

Caution - Do not damage the cap or body.

Disassembly of the body - *continued*

V. Removal of rear valve

Procedure: Remove gasket, valve plate and suction valve.

VI. Removal of front valve and working assembly

Procedure: Remove the working assembly by pressing the end of the shaft into the front of the body as shown. After removal of the cylinder, remove gasket, valve plate and suction valve from the front side.

Assembly of the body

I. Installation of the O-ring for rear cap

Procedure: The o-ring must be free from marks and dust. Thoroughly lubricate new o-ring properly and insert into the groove. Ensure the o-ring is lying straight in the groove without a twist.

II. Installation of rear valve plate and working assembly

Tools required: • Working assembly bench

Procedure: Stack suction plate, valve plate and gasket on locating pins of rear cap in sequence as shown in the figure. Place the working assembly on rear cap.

III. Installation of front valve plate and body

Tools required: • Working assembly bench

Procedure: Stack suction plate, valve plate and gasket on locating pins of working assembly. Slide body over working assembly until it stops on the working bench guide.

Assembly of the body - *continued*

IV. Inspection, tightening and clearance of the rear cap

Tools required: • Torque wrench • Hexagon socket 6mm
• Thickness guage

Procedure: Tension the M8 Hexagonal flange bolts (4pcs) diagonally, alternately and carefully. Check the rear cap clearance as specified: $0.2 \leq \text{Gap} \leq 0.6\text{mm}$

Tightening torque: $14.7 \pm 1 \text{ N}\cdot\text{m}$

V. Installation of lipseal (Refer to page 9 for instructions)

VI. Test working assembly rotation

Tools required: • Shaft rotating handle

Procedure: Install the handle into the front section to check the shaft rotates smoothly.

VII. Filling compressor oil

Procedure: Fill the following amount of oil into the drain hole as shown in the photo. Ensure drain is correctly plugged.

Standard oil type: Unidap 7 (PAG) or Unidap 3 (POE)

Amount of oil:

UP150/170 = $160 \pm 10 \text{ cc}$

UP90/120 = $140 \pm 10 \text{ cc}$

VIII. Drain plug

Procedure: Tighten drain plug.

Tightening torque: $11.7 \pm 1 \text{ N}\cdot\text{m}$

System oil quantity

The correct amount of oil must be maintained in the compressor and system. Long hose runs and dual evaporator systems must have additional oil added to the system. Severe oil starvation problems may result from insufficient system oil being allowed. To determine oil quantity required, Unicla recommends a calculation as a percentage of refrigerant charge as follows:

- **20% for all A-group compressors (90-170cc)** in standard applications where the suction and discharge lines are less than 6 metres in length.
- **30% for all A-group compressors (90-170cc)** in applications where suction and discharge lines exceed 6m in length.

Example: Calculate oil charge as 20% of refrigerant charge, 2 kg charge = 2000 g x 20% = 400 ml (cc) of oil. If fitting a UP/UX170 compressor, then deduct the compressor initial oil charge to determine amount of oil to be added. Therefore 400 – 160 = 240cc oil to be added to system.

Oil type and grade

Each Unicla A-Group compressor is fitted with either PAG oil (*Unidap 7*) or POE oil (*Unidap 3 is fitted to F-series compressors*). When adding oil to the system, Unicla oil must be used.

⚠ Warranty is void if these guidelines are not followed.

Compressor Model	Refrigerant	Oil Type (Unicla)	Viscosity @ 40°C	Viscosity @ 100°C	Application	Low side Saturation	Oil Separator
UP/UX 90/120/150/170	R134a	Unidap 7	48.01	10.51	Airconditioning	> 0°C	Optional
UPF 90/120/150/170	R404a	Unidap 3	32.5	5.8	Airconditioning	>15°C	Required

The following labels will determine the type of oil in each A-group or F-series compressor:

POE type
(fitted to F-series compressors)

PAG type

Storage guidelines

- Evacuate compressor for 3 minutes and fill with nitrogen (N₂) at 0.1 ~ 0.2 MPa.
- Place the compressor in a clean and dry area with low humidity and tag with details.
- Keep compressor away from direct sunlight.
- Store the compressor horizontally on a flat, even surface.
- Do not store the compressor in temperatures above 30°C.
- Place the compressor in a well ventilated area to avoid corrosion damage.
